index of refraction, by experiment  
determined, by using the method  
of dispersion of light, and the  
value of the refractive index  
was found to be 1.50, in the  
normal position, by using the  
method of minimum deviation.

The dispersion of light is  
due to the fact that the  
velocity of light varies with  
the wavelength, in a transparent  
medium. This is called dispersion  
of light. The refractive index  
of a medium is defined as the  
ratio of the velocity of light  
in vacuum to the velocity of  
light in the medium. The  
refractive index of a medium  
is a function of the wavelength  
of light. The refractive index  
of a medium is greater for  
shorter wavelengths and less  
for longer wavelengths. This  
is called normal dispersion.

The refractive index of a  
medium is a function of the  
wavelength of light. The  
refractive index of a medium  
is greater for shorter  
wavelengths and less for  
longer wavelengths. This is  
called normal dispersion.

I must remain in the laboratory

\* must come to laboratory this year to complete the work and see their progress. I must remain in the laboratory.
